Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479.*

//note="Organ: Lung; Vector: pT/T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; urcF-EC1 is a normalized cDNA library containing the following tissue(s): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT/T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is
                                                                                                                                                                                                                                                             ď

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an ollygo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT/T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /lab_host-"DH10B (Life Technologies)"

Sequence 958, Application US/09801274

Patent No. US20020032319A1

GENERAL INFORMATION:

APPLICANT: Cargill, Michele
APPLICANT: Lander, Eric S.

APPLICANT: Lander, Eric S.

TITLE OF INVENTION: HUMAN SIGILE NUCLEOTIDE POLYMORPHISMS

FILE REFERENCE: 2825_209-001

CURRENT FILING DATE: 2001-03-07

PRIOR APPLICATION NUMBER: US/09/801,274

CURRENT FILING DATE: 2000-03-07

PRIOR APPLICATION NUMBER: US 60/206,129

INSERTAL INFORMATION:

APPLICANT: Abarzua, Patricio

ITILE OF INVENTION: Excension

TITLE OF INVENTION: Excension

TITLE OF INVENTION: Excension

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /tissue_type="mycorrhizal roots"
/tissue_type="mycorrhizal roots"
/dev_stage="3 weeks after inoculation"
/note="vector: pGEM-Teasy; genotype A17; cDNA was prepared
from total RNA using the SMART PCR cDNA system (Clontech)
from roots harvested three weeks after inoculation with
Glomus intraradices. This cDNA was used as tester in a
Suppression Subtractive Hybridization (SSH). The SSH-cDNA
fragments were generated using the SSH-adaptor sequences
ctaatacgactcactatagggctcgagcgcgggcggggt and
ctaatacgactcactatagggcagcgtggtcgggcggggggt and
ligated after Suppression Subtractive Hybridization in to
the pGEM-Teasy vector from Promega. Plasmids containing
cDNA inserts were propagated in E. coli TOP 10F' cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNB42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA and transfermed into
                                                                  hideko@biol.tsukuba.ac.jp

/note="Organ: skin; Vector: pDNR-LIB (Clontech); Site_1:
Sfil (ggccgcctcggcc); Site_2: Sfil (ggccattatggcc);
Double-stranded cDNA was prepared from cell line RNA. 5'
and 3' adaptors were used in cloning as follows: 5'
adaptor sequence: 5'-CACGGCCATTATGGCC-3' and 3' adaptor
sequence: 5'-ATTCTACAGGCCGACGTC-dT(30)BN-3'
(where B = A, C, Or G and N = A, C, G, Or T). Average
insert size 1.75 kb (range 0.9-4.0 kb). 15/15 colonies
contained inserts by PCR. This library was enriched for
full-length clones and was constructed by Clontech
Laboratories (Palo Alto, CA)."
